

BamPRO Stakes

The advantages

Huge range of quality BamPro stakes available. The environmental alternative to hardwood stakes.

BamPro Stake

Stakes are milled from large bamboo, sawn and pointed. Stakes have a hardwood stake profile as an alternative to the hardwood stakes.

| BAMPRO1501525 | Bamboo Stake 150cm 15x25mm | 25pk |

What are the differences between Bamboo and Hardwood stakes?

BamPRO™ stakes (bamboo-based stakes) have some clear advantages over conventional timber or plastic stakes, especially in environmental and performance contexts. Here are the key benefits:

They are Sawn like Hardwood, but made from Bamboo.

Environmental Benefits

Sustainable & renewable – Bamboo is one of the fastest-growing plants in the world, regenerating quickly without replanting.

Lower carbon footprint – Significantly less embodied carbon compared to treated timber or plastic stakes.

Biodegradable – Naturally breaks down over time, avoiding long-term waste streams.

Performance Benefits

Strong & durable – Despite being lightweight, bamboo has excellent tensile strength, making BamPRO stakes resistant to snapping under wind or pressure.

Pest & rot resistance – Naturally resistant to termites and decay (more so than untreated hardwood).

Consistent sizing & finish – Manufactured to uniform sizes, which helps with installation and appearance in large-scale planting.

Practical/Project Benefits

Cost-effective over lifecycle – While upfront cost may be slightly higher than hardwood stakes, reduced breakage and longer durability often lower replacement costs.

Safe to handle – Smooth finish with fewer splinters compared to sawn hardwood stakes.

Supports compliance & ESG goals – Many councils and contractors prefer bamboo over treated timber because it avoids chemical leaching and supports sustainability targets.

In Summary:

BamPRO stakes give you strength and durability like hardwood, without the environmental downsides, and with the added benefit of being safer and more sustainable.
